

## Detect compromised personal information sooner, no matter where it occurs.

It's hard to remember the credentials for all of the online accounts we keep in today's world, and it's common practice for consumers to use the same username and password combination across multiple sites. What consumers may not realize is that in doing this, they open themselves up to increased risk of online fraud. If one of the sites under which they have an account is cracked and their credentials are made known, it may be possible for fraudsters to access their accounts on other sites as well.

Enter CyberAgent, our proprietary technology that proactively detects stolen personally identifiable information (PII) and compromised confidential data online. CyberAgent is the only identity monitoring solution designed for proactive cyber detection on an international level - breaking language barriers and detecting identity theft across the globe. And at any point in time, our CyberAgent technology is monitoring thousands of websites and millions of data points, alerting consumers if we find their personal information in a compromised position online. This information is being gathered in real-time, giving both consumers the opportunity to react quickly and take the necessary steps to protect themselves.

## Comprehensive Identity Protection Offering
